## 1 Dataset

Table 1: Dataset details used in experiments.

| Dataset    | # Rows<br>(Instances) | # Columns<br>(Features + Target) |
|------------|-----------------------|----------------------------------|
| philippine | 5,832                 | 309                              |
| jasmine    | 2,984                 | 145                              |
| jannis     | 83,733                | 55                               |
| helena     | 65,196                | 28                               |
| fabert     | 8,237                 | 801                              |
| dilbert    | 10,000                | 2,001                            |
| robert     | 10,000                | 7,201                            |
| albert     | 425,240               | 79                               |
| digits     | 1,797                 | 65                               |
| dionis     | 416,188               | 61                               |

## 2 Search Space Option 1: Detailed Table

Table 2: AutoML Search Space Configuration

| Preprocessors (14)                      | Hyperparameters                                                                                                                     |
|-----------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------|
| Binarizer                               | threshold $\in [0.0, 1.0]$ (step 0.05)                                                                                              |
| FastICA                                 | tol $\in [0.0, 1.0]$ (step 0.05)                                                                                                    |
| FeatureAgglomeration                    | linkage $\in \{\text{ward, complete, average}\}$ ,<br>affinity $\in \{\text{euclidean, l1, l2, manhattan, cosine}\}$                |
| MaxAbsScaler, MinMaxScaler              | No hyperparameters                                                                                                                  |
| RobustScaler, StandardScaler, ZeroCount | No hyperparameters                                                                                                                  |
| Normalizer                              | norm $\in \{\text{l1, l2, max}\}$                                                                                                   |
| Nystroem                                | kernel $\in \{\text{rbf, cosine, chi2, ...}\}$ ,<br>gamma $\in [0.0, 1.0]$ , n_components $\in [1, 11]$                             |
| PCA                                     | svd_solver = randomized, iterated_power $\in [1, 11]$                                                                               |
| PolynomialFeatures                      | degree = 2, include_bias = False                                                                                                    |
